1. It would be possible to alter the subject matters of document 1 (Fig. 1), document 2 (Fig. 2) and document 3 (Fig. 2) into a constitution wherein a source electrode for an auxiliary switch is connected with a first resistor element in view of well-known design examples of circuit configurations whereby two input voltages to a differential amplifier are made equal to each other by feeding the output of the said differential amplifier back to the gate electrode of MOSFET (see document 7, if necessary).
2. Each of "an amplifier" of claim 1, and 21 in Fig. 1 of document 1, 61 in Fig. 2 of document 2 and CMP11 in Fig. 2 of document 3 is given a predetermined gain. Calling such units with that gain an "amplifier" or a "comparator" is merely a matter of naming, and there are no substantial differences between "an amplifier" of claim 1, and 21 in Fig. 1 of document 1, 61 in Fig. 2 of document 2 or CMP11 in Fig. 2 of document 3.
3. The subject matters of claims 1 and 2 do not appear to be novel or to involve an inventive step in view of documents 1-3 cited in the ISR, and document 7 newly cited in this report.
4. The subject matters of claims 6 and 7 do not appear to be novel or to involve an inventive step in view of documents 1 and 2 cited in the ISR, and document 7 newly cited in this report.

5. The way of connecting "a third switch" in the subject matters of claims 3, 4, 8 and 9, and the way of connecting "a first resistor element" in the subject matters of claims 5 and 10, are neither described in any of the documents cited in the ISR and this report nor obvious to a person skilled in the art.
